Install OpenTX Companion

OpenTX Comanion is a PC software tool that you can use to backup, edit and share your Taranis radio's settings. It can also simulate both a model's setup and the radio's own interface on the computer, so it's a great tool to try things even without a radio. This tool is used to update the firmware so you can see a great [OpenTX manual 989](#) on how to use it, or download the extracted chapter below:[OpenTX Companion Manual.pdf 124](#) Lastly if you are having any issues getting your Taranis to talk to your PC, [this thread 683](#) might help.

Download the latest Companion from <http://www.open-tx.org/downloads.html>, Then click on the file and go through the installation. after installation, edit Companion settings like pic below(the radio type option depends on your own TX):

After edit settings, now you can download firmware through Companion like like pic below:

Update firmware via SD Card

1. First remove the SD card from the battery compartment of the Taranis. If you have a micro SD reader, use this to read it via the computer. If not, you can select the USB mass storage option once the Taranis is powered on for mass storage and use the USB cable instead.

Download the firmware and put the file into the 'FIRMWARES' or 'FIRMWARE' (depending on what firmware you're using) folder on you TX. Creat one if no such folder exist.

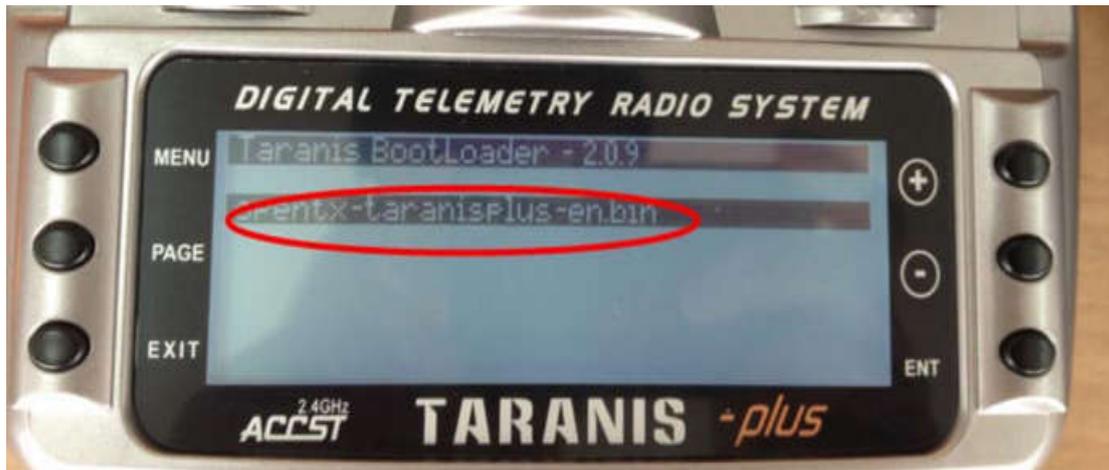

BMP	2014/8/8 11:18
EEPROMS	2014/8/8 11:21
FIRMWARES	2014/8/8 11:17
LOGS	2014/8/8 11:21
MODELS	2014/8/8 11:17
SCRIPTS	2014/8/8 11:17
SOUNDS	2014/8/8 11:17

Sometimes (depending on what firmware you're using) , **the firmware filename should be less than 8 characters long, otherwise the taranis can't read the file, so you will probably have to rename it**

2. Backup your files if necessary, Make a backup copy of the Taranis SD card and put the files in a directory on your PC, or Use the "Backup [Radio](#) to File" icon on the left side of Companion to backup files.
3. Now put the micro SD card back into the slot in the battery compartment. To enter the 'Bootloader' mode, with the taranis turned off, while holding T1 and T4 trim buttons inwards, then turn on the taranis.

- Then select 'Write Firmware', select the .bin firmware file you would like to upgrade to and then press and hold the enter (ENT button).

- Once complete, turn off your transmitter. You should now have upgraded your Taranis.

Operating multi-protocol module through TX menu

Once upgraded your Taranis with correct firmware, The model protocol selection and binding can be done from the Model Settings menu on the transmitter. For telemetry capable transmitters, it supports telemetry function as well.

Make sure the multi-protocol module is in serial mode, plug it into your TX, power on the external RF. then you can Operate multi-protocol module through TX menu .
